

find minimum 7 values of $J(n)$ where the last person standing is the survivor ($k=2$ by default)

$$J(n, 2)$$

for the classic Josephus problem:-

$$J(n) = 2L + 1 \quad \text{where} \quad n = 2^m + L \quad \text{and} \quad 2^m \leq n$$

Here,

$2^m \leq n$: largest power of 2 less eq to n ,

L = Remaining part after subtracting that power of 2

Minimum 7 values of n are 1, 2, 3, 4, 5, 6, 7

Thus, $n = \{1, 2, 3, 4, 5, 6, 7\}$

table banao,

$\rightarrow m = n$, condition satisfy

n	$2^m \leq n$	$L = n - 2^m$	$J(n) = 2L + 1$	survivor
1	1	0	$2 \times 0 + 1$	1
2	2	0	$2 \times 0 + 1$	1
3	2	1	$2 \times 1 + 1$	3
4	4	0	$2 \times 0 + 1$	1
5	4	1	$2 \times 1 + 1$	3
6	4	2	$2 \times 2 + 1$	5
7	4	3	$2 \times 3 + 1$	7

$m=0$ condition satisfy

$$2^0 = 1$$

$$2^1 = 2 \Rightarrow 2 \leq 2$$

$$2^2 = 4 \Rightarrow$$

$$\therefore J(1) = 1, J(2) = 1, J(3) = 3, J(4) = 1, J(5) = 3$$

$$J(6) = 5, J(7) = 7$$

Ans

ସମସ୍ତଙ୍କୁ ଏହି ସମସ୍ୟା ଦେଖାଇ ଦିଅ

Recursive (same define ନିମ୍ନ)

$$\text{even } J(2n) = 2J(n) - 1 \quad \left. \begin{array}{l} \text{even} \\ \text{odd} \end{array} \right\} \text{Recu}$$

$$\text{odd } J(2n+1) = 2J(n) + 1$$

ev number, odd number ପାଇଁ,

$$\text{even } 2J(n) - 1$$

$$\text{odd } 2J(n) + 1$$

form of formula ରେ

find the val of $J(130) = ?$

base case ହେଉଛି,

$$J(1) = 1$$

Since 130 is even so we use

$$J(2n) = 2J(n) - 1$$

130 ହେଉଛି
2 ଥର 65 ଥିବାରୁ

$$J(2 \times 65) = 2J(65) - 1 = 5$$

କିନ୍ତୁ ଏହାଟି (3)ର ଉତ୍ତର
ନୁହେଁ, ସତ୍ୟ long ରେ

since 65 is odd so use use

$$J(2n+1) = 2J(n) + 1$$

$$J\left(\frac{2 \times 32 + 1}{65}\right) = 2J(32) + 1 = 2 \times 1 + 1 = 3$$

↓
As per the
value of 32

$$Hr J\left(\frac{2 \times 16}{32}\right) = 2J(16) - 1 = 2 \times$$

$$J(8) - 1 = 2 \times 1 - 1 = 1$$

$$J\left(\frac{2 \times 4}{8}\right) = 2J(4) - 1 = 2 \times 1 - 1 = 1$$

$$J\left(\frac{2 \times 2}{4}\right) = 2J(2) - 1 = 2 \times 1$$

$$J\left(\frac{2 \times 1}{2}\right) = 2J(1) - 1 = 2 \times 1 - 1 = 1$$

$$\text{so } J(100) = 5$$

Ans

Joseph the Recursion prob solve may,

Tower

Tower of Hanoi

Source tower
to go to start transfer tower.

also change also also start transfer

Rules :

- i) we can move only one disk at a time
- ii) we can move only the top disk from any peg.
- iii) A larger disk can never be placed on a smaller disk.

We assume there are n numbers of disk
our goal is transfer from A to a peg
using aux peg B.

→ Step 1: move $n-1$ disk from A to B.
using C as helper.

(C target but B to any other any case)

→ Step 2: move the largest disk from A to C

→ Step 3: move $(n-1)$ disk from B to C
using A as helper

3 or more larger disks
2 like start moving.

Recursive ?

Recursive eqn

$$T(n) = T(n-1) + \underset{\substack{\downarrow \\ \text{to} \\ \text{disk}}}{1} + T(n-2)$$

$$= 2T(n-1) + 1 \quad \text{--- (1) ToH (Recursive eqn)}$$

base case :

$$T(1) = 1$$

$$T(n) = 2^n - 1$$

$$T(3) = 2^3 - 1 = 7 \quad \left(\begin{array}{l} 7 \text{ are } 7 \text{ move} \\ \text{to solve} \end{array} \right) \quad \text{(move number)}$$

$$T(4) = 2^4 - 1 = 15 \rightarrow \text{move number}$$

$$T(5) = 2^5 - 1 = 31$$

for and other prob 1

② Prob 2 (move string)

A → C → target

A → B → aux

C → B

A → C

B → A

Que : 3 number move (move to disk) (move to aux)

Q: which disk where?

Initial position:

3 disks (or 4 disks)
 2 bits for start, 1 bit for end

Peg	Disks
A	D_3, D_2, D_1
B	empty;
C	empty;

$D_1 = \text{smallest}$
 $D_2 = \text{mid}$
 $D_3 = \text{biggest}$

A	$D_3, D_2, D_1; D_3, D_2; D_3; D_3;$
B	empty; empty; $D_2; D_2, D_1$
C	empty; D_1, D_1 ; empty;

After the third move,

A has D_3 , B has D_2, D_1 and C is empty

6. $B \rightarrow C$

3rd problems

आमतौर पर move को हम necessary कहते हैं, explanation उनके लिए जो move base and marks हैं,

Peg	0	1	2	3	4	5	Disk
A	$D_3 D_2 D_1$	$D_3 D_2$	D_3	P_3	empty	P_3	D_1
B	empty	empty	D_2	$D_2 D_1$	$D_2 D_1$	D_2	empty
C	empty	D_1	D_1	empty	D_3	P_3	$P_3 D_2$

अब move को basic operation में लेते हैं।

5 move में $A \rightarrow P_1, B \rightarrow D_2, C \rightarrow P_3$ (1) D_3 largest
 D_1 को P_2 पर डालें, अब P_2 में D_1 है। D_2 mid
 P_1 smallest
 A to C

P_2 को C पर उतारें B फलाने।
 almost solve, अब 1 move फलाने, solve, अब 2 move

4 move में

D_1 को A पर उतारें, P_2 को C पर उतारें, अब 2 move में solve करेंगे, logical choice behind the move.

4th problem:

$$T(n) = 2T(n-1) + 1$$

$$T(n) = 2^n - 1$$

min num of moves.

→ prove that
eqn is correct
for all n

(Mathematical

$$T(n) = T(n-1) + 1 + T(n-1) = 2T(n-1) + 1$$

induction base

$$T(1) = 1$$

→ for n=1, formula is correct
check

→ prove that

$$T(n) = 2T(n-1) + 1$$

→ solve it
and prove

$$T(n) = 2^n - 1$$

$$T(n) = 2^n - 1$$

step 1: base case :-

for n=1; there is only one disk

$$T(1) = 1$$

$$T(1) = 2^1 - 1 = 1$$

Therefore the formula
is true for n=1

→ formula is correct
check

→ check so the minimum number of moves
will be 1, also using the eqn (1) we
get

Step 2 : Induction hypothesis :- (assume true for $n=k$)
 Assume the formula is true for $n=k$;

That means $T(k) = 2^k - 1$

(for $n=k$ we say $n=k+1$ is true)

Now we must prove that, the formula is also true for

$$T(k+1) = 2^{k+1} - 1 \quad n = k+1. \text{ That means } \circ$$

Step 3 : Induction step

$$T(n) = 2T(n-1) + 1$$

$$T(n+1) =$$

$$T(k+1) = 2T(k) + 1$$

$$= 2$$

$$= 2 \cdot 2^k$$

Step 4 : conclusion.

→ The formula is true for $n=1$

→ If the formula is true for $n=k$, then it is also true for $n=k+1$ (assume true for $n=k$)

Therefore, by mathematical induction,

$$T(n) = 2^n - 1 \text{ for } n \geq 1$$

(proved)
